

Introduction

Digital content is a new type of good that requires analysis from various aspects of necessary protection. This shift stems from a novel approach where, for the first time, the regulation of digital service infrastructure is subordinated to the regulation of digital content. Previously, significant questions arose about the boundaries of applying infrastructure regulations to content, where competitiveness and the security of systems supporting digital services were paramount. It seems that the new direction reverses this, subordinating infrastructure regulation to the regulation of digital content. This approach forms the basis of the current concept for protecting the content that fills the internet.

The first issue of dot.pl is an attempt to comprehensively present various aspects of working with digital content, which is subject to current and future legal regulations. The journal will be a valuable resource for the domain market community as well as practitioners for whom the digital world is of key importance. It addresses topics related to the development of new technologies, e-commerce, cyberspace, and the legal status of individuals in the digital world. The issues discussed in our journal are relevant to every internet user and business entities operating broadly defined digital services.
